

PRODUCT OVERVIEW

Nlyte Next Generation Application Tracker provides organizations with a complete understanding of how employees interact with their IT assets and how these assets support them in meeting their business objectives.

Application Tracker provides:

- Identification of redundant, under or improperly utilized IT assets (asset management)
- Accurate software license management
- Accurate billing and charge back
- Server consolidation based on actual usage
- Full IT policy compliance
- Full internal security policy compliance
- Identification of training requirements
- Identification of IT infrastructure requirements
- Legacy system audit reporting for usage or retirement

Nlyte Application Tracker is a complete business process solution designed specifically to address the interaction of computer hardware and software with an organization's staff. Application Tracker delivers understanding of how computers are used, when, and by whom. This information provides the ability to analyze the efficiency of an organization's working processes. Inefficiencies and low performance areas can then be identified and corrected and the proper procedures and

Nlyte Application Tracker (global software efficiency)

- *Accurate billing and charge back*
- *Based on actual usage*

policies implemented to ensure maximum return on asset investments (ROI).

Until now, asset management and metering software have been limited to reporting on the device or application and its basic properties. Nlyte's next generation Application Tracker bridges the important gap between the device and the user, to provide an understanding between the organization's assets and business processes. Asset Tracker is a performance management and monitoring tool that provides mission critical information on an organization's most critical resources. Nlyte Asset Tracker enables the ability to:

- Manage hardware and software asset usage
- Monitor software license inventory
- Analyze and improve business processes
- Implement, manage and monitor IT policy

the success of any organization is highly dependent on its IT resources and the way they are used. Asset management is imperative to manage how assets are utilized, to fully understand business operations and improve operational productivity.

more than just software metering, monitoring the software used, who it is used by, and what it is used for will improve operational efficiency and eliminate unnecessary asset related expenditures. Recognize which applications are required to run the organization and eliminate non-essential packages and their associated costs. Creating software standards throughout an organization reduces license, support and training costs.

understand what hardware and software is used, when it is used, for how long, and by whom. This will provide a good understanding of how efficiently the organization is operating and if technology is being used to its optimum level. Nlyte Application Tracker's web-based reports provide the knowledge needed to understand how the organization is functioning. The reports identify inefficiencies or low productivity of assets, and help put the required policies and training in place to increase both efficiency and productivity.

increase staff awareness of IT policy and ensure compliance. Good IT policy management increases data security, improves IT efficiency, decreases bandwidth requirements of your computer networks and reduces the threat of legal exposure through harassment or security vulnerabilities.

Nlyte's Next Generation Application Tracker is part of Nlyte's Technology Asset Management (TAM) Solution suite. Nlyte's TAM offerings include:

to help you track hardware and software usage from the user perspective; Identify unnecessary technology; Improve business processes and efficiency.

discovers and identifies software packages; manages risk of unauthorized installation, applications, and access; provides software vendor compliance auditing and reporting.

discovers and validates all assets and attributes, known and unknown, on the network establishing a complete technology asset baseline; delivers a normalized single source of truth database that shares information across IT and Business Intelligence Systems.
